Important Equipment Warning For GPS Module Connections

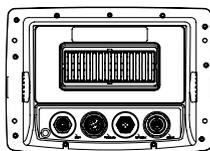

Your unit packs with cables, a black T connector and a terminator to connect the GPS module to the unit. Plugs and sockets on these items are keyed. That is, each male plug has a key that fits an alignment notch or keyway in each female socket.

Left, T connector. Center, extension cable. Right, end view of the socket on a female connector. Note the alignment notch or keyway.

WARNING:

You can over-ride the key protection feature if the connectors are misaligned and then forced together. This can damage the unit or GPS module.

In the diagram at right, asterisks (*) show where damage can occur if plugs and sockets are misaligned.
